

KasKold Quick Start Guide

Hardware and Vault custody, watch-only Companion, recovery, signing, and release verification

KasKold is security-critical self-custody software. Keep tested recovery backups and authorize spends on the signer, not on Companion.

1. Choose the application

Application	Role
KasKold Hardware	Create/restore/review/sign on purpose-built CoreS3 hardware
Vault Web	Create/restore/review/sign in a browser signer with no blockchain watcher
Vault Android / iOS	Create/restore/review/sign in dedicated native signer apps
Companion Web / Android / iOS	Watch-only kpub management, network state, transaction construction and broadcast

2. Create or restore

- Create or restore the wallet only in KasKold Hardware or a Vault app.
- Back up the BIP39 mnemonic plus optional passphrase before relying on the wallet.
- Export only the public kpub to Companion.

3. Use Companion

- Load/manage the kpub on Companion startup.
- Use watch-only tools for balances, history, Broadcast TX, Multisig, and transaction construction.
- When a signature is needed, transfer the signing request to Hardware/Vault and return the signed response.

4. Verify releases and qualification

Use **make release** for the reproducible normal-release build and manifest verification. Secure Boot provisioning is separate and explicit. CoreS3 Lite remains qualification-pending until physical HIL evidence is recorded.
